Fire-tube coil economisers (SOV) are mainly used as economisers for a preheating of feeding water for steam boilers. SOV can be also used for a preheating of inlet water for hot-water boilers (adaptation of dimensions of connections for inlet and outlet water).

By prior arrangement with the producer economisers can be also used for other purposes.

Apart from the specified connections the economiser is equipped with a discharge branch (DN 25), deaeration and an eyehole.

Dimensions in the table are informative.
